

## PASSIVE PICKUPS INSTALLATION INSTRUCTIONS

To install the pickups, you will need: a screwdriver, a soldering iron, a soldering iron stand, solder with rosin, a sponge for cleaning the tip, tweezers, possibly pliers for cutting wires, a soldering fume extractor and personal protective equipment (safety glasses, a protective mask). During installation, ensure proper ventilation of the room and proper lighting.

The ends of the pickup wires should be soldered to the pre-prepared electrical system in the electric guitar according to the connection diagram and the color markings of the wires. The connection diagrams are in a separate file. The included screws and springs are used for mounting and adjusting the height of the pickup. Use tweezers to hold the wires during soldering.

Follow the recommendations below.

### **NOTE: WARNINGS AND SAFETY**

We do not recommend mounting pickups to people who do not have the right equipment, knowledge and experience. The mounting of pickups should be performed by people with the right qualifications and experience. To avoid hazards resulting from the mounting and the possibility of damaging the pickup, we recommend having the pickups mounted at a guitar service.

### **WARNINGS REGARDING HAZARDS ASSOCIATED WITH TRANSDUCER INSTALLATION**

- To prevent inhalation of soldering fumes, assembly should be carried out in a ventilated room, and it is recommended to use a protective mask and a soldering fume extractor.
- When soldering or shortening wires, wear safety glasses and a long-sleeved shirt to prevent burns from solder spatter.
- Place soldering irons on their stand to avoid burns or the possibility of a fire.
- Use only functional equipment to install pickups.

All Jakubiszyn Pickups Spółka Jawna transducers have a 5-year warranty.

The pickups should be stored in a dry place.
